5.3. WISCONSIN RESEARCH AND EDUCATION NETWORK

The Wisconsin Research and Education Network (WREN) is a statewide practice-based research network (PBRN) of primary care clinicians and academic researchers. Its vision is to improve health outcomes for the people of Wisconsin and beyond as a model practice-based research network. Its mission is to promote and conduct primary care research and education in partnership with primary care clinicians and the communities they serve.

Highlights

- **Sustainability.** WREN has been in continuous operation since 1987, making it one of the oldest PBRNs in the country.

- **Engagement.** WREN disseminates practical and research information to more than 1200 individuals, including clinicians, researchers and staff across the state of Wisconsin and beyond.

- **Statewide research.** During FY18, WREN was engaged in 13 clinical and practice improvement research projects. Topics included shared decision-making, health literacy training for elderly caregivers, opioid use in chronic pain, opioid addiction, advance care planning, cancer survivorship care planning, and the workload of clinic teams.

- **Increased funding.** WREN has continued to attract high-quality, high-caliber projects supported by federal and local funding, including private foundations.
WREN 2017 Convocation of Practices:

The beautiful location—the UW Arboretum in Madison—served as an appropriate backdrop for learning about incorporating a patient’s health goals into their care, turning the question of “What’s the matter?” to “What matters to you?”; understanding how to effectively coach patients with chronic conditions through the self-management support framework; and key elements of shared decision making conversations.

WREN study results in the news. “Cough Drops: Cause for Concern?,” a patient survey-based study, was initiated by WREN associate Dr. Robert Mead of Bellin Health in Green Bay, Wisconsin. Dr. Mead made clinical observations suggesting that cough drops containing menthol may actually prolong and/or worsen some coughs.

The goal of the study was to understand how many people with an acute cough use cough drops or throat lozenges, and whether menthol-containing products, compared to non-menthol products, are associated with cough severity.

Study results captured the interest of local media: the Wisconsin State Journal published an article, “Too Many Cough Drops Might Make Coughs Worse,” and WISC-TV Channel 3 interviewed study PI Dr. David Hahn for a story, “Can Too Many Cough Drops Make Cough Worse?”
Results were also published in the March-April 2018 issue of the *Journal of the American Board of Family Medicine*: “Menthol Cough Drops: Cause for Concern?” Healio Family Medicine published an online version, “Menthol Cough Drops May Worsen Cough.”
